

CIT 352 Chap 02 Create a Virtual Machine on VirtualBox to Install Fedora

This document shows you how to configure a virtual machine on VirtualBox for the installation of Fedora. There are three steps involved:

1. Download Software
2. Install the Hypervisor
3. Configure a Virtual Machine

1. Download Software

Download the latest version (but not Beta) of the following pieces of software to your PC/Mac.

- VirtualBox Platform Package (<https://www.virtualbox.org/wiki/Downloads>)
- VirtualBox Extension Pack (the same place as above)
- Fedora Workstation [Fedora: x86_64 DVD ISO]
(<https://getfedora.org/en/workstation/download/>)

2. Install the Hypervisor (VirtualBox)

Install the following pieces of software by following the prompts:

- VirtualBox Platform Package
- VirtualBox Extension Pack

3. Configure a Virtual Machine

You will create and configure a virtual machine on Virtual Box. Follow the steps below.

Please note that the example below uses Fedora 32, the latest version available at the time this tutorial was written. You may be using a newer version. The configuration stays the same.
